Recommendation Systems

Recommendation engines can make a range of different recommendations

Recommender systems allow us to personalize a user's experience

Google Search is a great example of how recommendation engines provide personalization

Recommenders help you find content that goes together

Recommender systems provide a way to keep us engaged

Recommender systems have become an important way for businesses to interact with their customers

Recommender systems provide benefit for both people who provide them and people who use them

- 1 Help users find related content.
- 2 Help users explore new items.
- 3 Improve user decision making.

There are benefits for producers of recommendation systems too

- 1 Increase user engagement.
- 2 Learn more about customers.
- 3 Change user behavior.

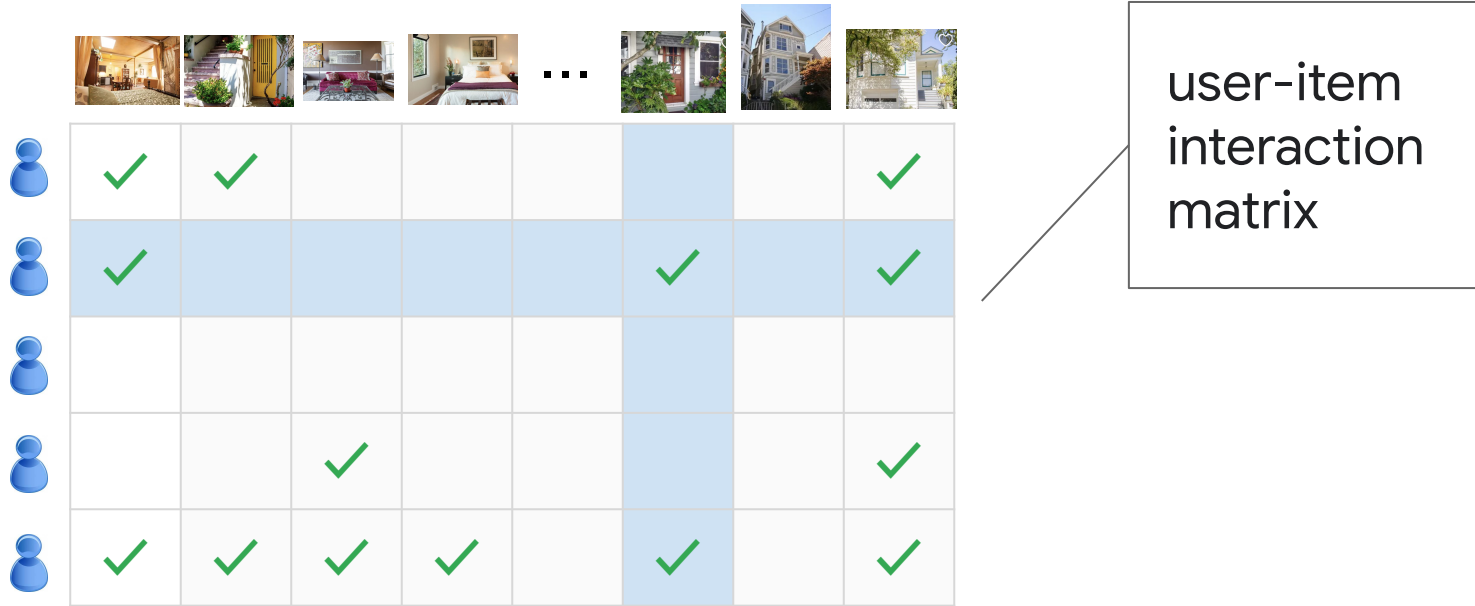

Learn how to...

Distinguish between different type of recommendation engines.

Design and build your own recommendation engine.

Anticipate common problems that arise when developing recommendation engines.

How would you recommend a vacation house to a user?

Lab

Design a recommendation engine for vacation property rentals

How would you recommend a vacation house to a user?

					...			
Features								
Properties of the user								
Properties of the house	✓	✓						✓
Previous rentals of a user	✓					✓		✓
Previous renters of a house								
Compare similar users								
Compare similar items			✓					✓
Targets								
Rating for unseen properties	✓	✓	✓	✓		✓		✓
Next rental property								

Popular types of recommendation engines

1 Content-based recommender system

2 Collaborative filtering

3 Knowledge-based

4 Deep neural networks

Content-based filtering uses attributes of the items to recommend new items to a user

					...			
	✓	✓						✓
	✓					✓		✓
								
			✓					✓
	✓	✓	✓	✓		✓		✓

Doesn't take into account the behavior or ratings of other users.

Collaborative filtering uses similarities between users and items simultaneously to determine recommendations

Knowledge-based recommender systems use explicit knowledge

					...			
	✓	✓						✓
	✓					✓		✓
								
			✓					✓
	✓	✓	✓	✓		✓		✓

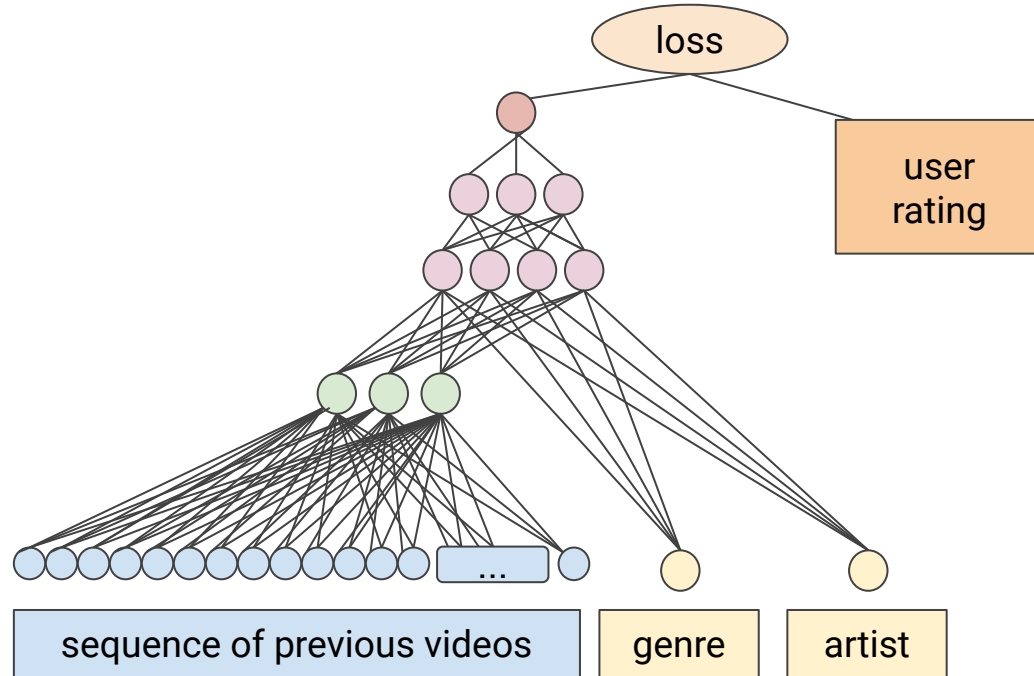

Use explicit knowledge about the users, items, and recommendation criteria.

Often there is value in combining different types of recommendation models into a single hybrid approach

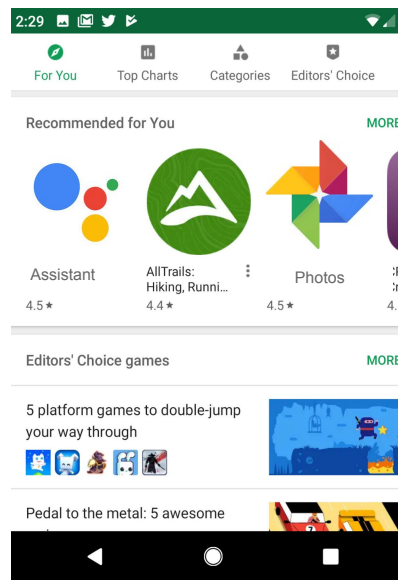

Deep neural networks can be trained to predict ratings based on user and item attributes

Quiz: The model recommends a hiking app to a user because they recently installed a similar app. This is an example of what kind of filtering?

- A. Content-based filtering
- B. Collaborative filtering
- C. Deep neural network
- D. Hybrid approach

Quiz: The model recommends a hiking app to a user because they recently installed a similar app. This is an example of what kind of filtering?

A. Content-based filtering

B. Collaborative filtering

C. Deep neural network

D. Hybrid approach

Quiz: The model recommends a hiking app to a user because they recently installed a similar app. This is an example of what kind of filtering?

A. Content-based filtering

~~B. Collaborative filtering~~

~~C. Deep neural network~~

~~D. Hybrid approach~~

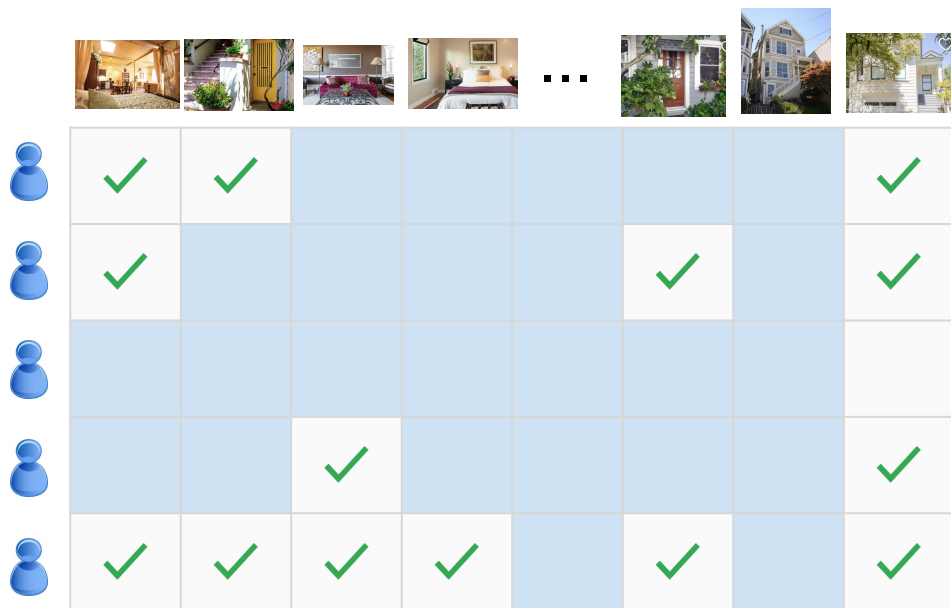

The user space and product space are sparse and skewed

					...			
	✓	✓						✓
	✓					✓		✓
								
			✓					✓
	✓	✓	✓	✓		✓		✓

The user space and product space are sparse

Most items are rated by very few users.

Most users rate only a small fraction of items.

The user space and product space are skewed

					...			
	✓	✓						✓
	✓					✓		✓
								
			✓					✓
	✓	✓	✓	✓		✓		✓

Some properties are very popular.

Some users are very prolific.

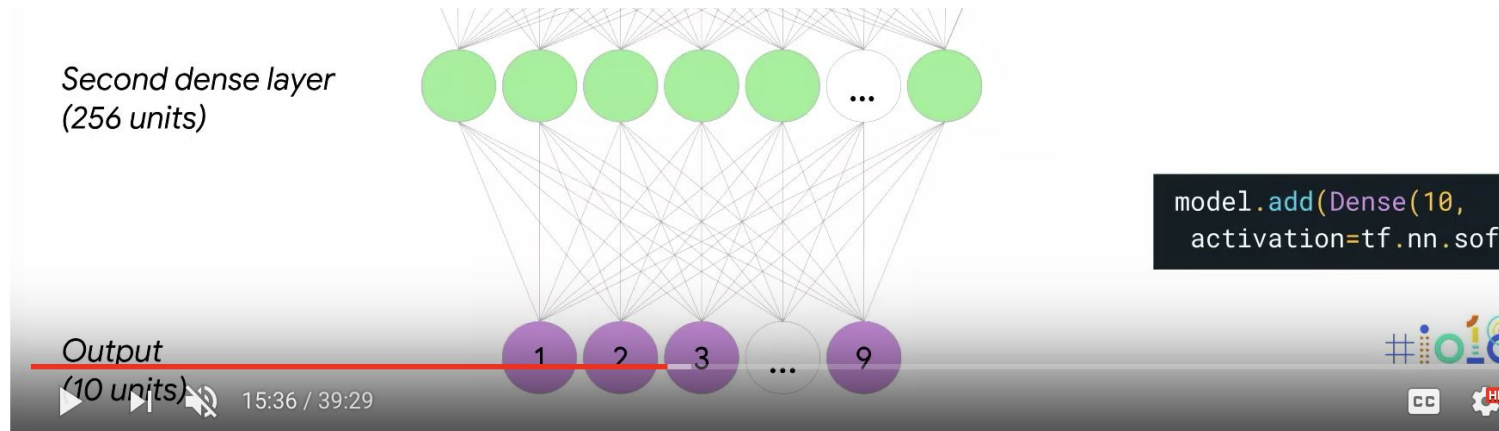

The cold start problem occurs when there aren't enough interactions for users or items

					...			
	✓	✓						✓
	✓					✓		✓
								
			✓					✓
	✓	✓	✓	✓		✓		✓

Explicit user feedback is often rare or unobservable

The diagram illustrates a neural network architecture. The top layer, labeled "Second dense layer (256 units)", consists of green circles representing units. Below it is a layer of purple circles representing units, with some labeled 1, 2, 3, ..., 9. A red line is drawn across the purple layer, with the text "Output (10 units)" written above it. To the right of the diagram, a code snippet is shown:

```
model.add(Dense(10, activation=tf.nn.softmax))
```

Quiz: Which of the following is NOT a problem that can arise when building a recommendation engine?

- A. Sparse user-item rating matrix
- B. Not enough user or item interaction information
- C. The user-item rating matrix is heavily skewed
- D. Too much explicit user feedback data to process
- E. Lack of explicit ratings

Quiz: Which of the following is NOT a problem that can arise when building a recommendation engine?

- D. Too much explicit user feedback data to process
- E. Lack of explicit ratings

Lab

Pick a personalization need for your company and design a recommendation system around it

Quiz: Which of the following are good reasons to build and use a recommendation engine?

- A. Everything's better with machine learning
- B. To personalize the user's experience
- C. To direct users to sponsored items
- D. The math behind them is really cool
- E. To surface relevant content from possibly millions of items

Quiz: Which of the following are good reasons to build and use a recommendation engine?

A. Everything's better with machine learning

B. To personalize the user's experience

C. To direct users to sponsored items

D. The math behind them is really cool

E. To surface relevant content from possibly millions of items
